# Lexical Analysis 

CMPT 379: Compilers<br>Instructor: Anoop Sarkar<br>anoopsarkar.github.io/compilers-class

## Building a Lexical Analyzer

- Token $\Rightarrow$ Pattern
- Pattern $\Rightarrow$ Regular Expression
- Regular Expression $\Rightarrow$ NFA
- NFA $\Rightarrow$ DFA
- DFA $\Rightarrow$ Table-driven implementation of DFA

## Thompson's construction

- Converts regexps to equivalent NFA
- Six simple rules
- Empty language
- Symbols ( $\Sigma$ )
- Empty String ( $\varepsilon$ )
- Alternation ( $r_{1}$ or $r_{2}$ )

> Used by Ken Thompson for pattern-based search in text editor QED (1968)

- Concatenation ( $r_{1}$ followed by $r_{2}$ )
- Repetition $\left(r_{1}{ }^{*}\right)$

## Thompson Rule 0

- For the empty language $\phi$
- (optionally include a sinkhole state)

## Thompson Rule 1

- For each symbol $x$ of the alphabet, there is a NFA that accepts it

## Thompson Rule 2

- There is an NFA that accepts only $\varepsilon$

Thompson Rule 3

- Given 2 NFAs $r_{1}, r_{2}$, there is a NFA that accepts $r_{1} \mid r_{2}$

Thompson Rule 3

- Given 2 NFAs $r_{1}, r_{2}$, there is a NFA that accepts $r_{1} \mid r_{2}$

Thompson Rule 4

- Given 2 NFAs $r_{1}, r_{2}$, there is a NFA that accepts $r_{1} r_{2}$

Thompson Rule 4

- Given 2 NFAs $r_{1}, r_{2}$, there is a NFA that accepts $r_{1} r_{2}$

Thompson Rule 4

- Given 2 NFAs $r_{1}, r_{2}$, there is a NFA that accepts $r_{1} r_{2}$

## Thompson Rule 5

- Given an NFA for $r$, there is an NFA that accepts $r^{*}$

## Thompson Rule 5

- Given an NFA for $r$, there is an NFA that accepts $r^{*}$

## Example

- Set of all binary strings that are divisible by four (include 0 in this set)
- Defined by the regexp: $\left((0 \mid 1)^{*} 00\right) \mid 0$
- Apply Thompson's Rules to create an NFA

## Basic Blocks 0 and 1

## $0 \mid 1$ <br> $\left((0 \mid 1)^{*} 00\right) \mid 0$

(0|1)*
$\left((0 \mid 1)^{*} 00\right) \mid 0$

$(0 \mid 1)^{*} 00$
$\left((0 \mid 1)^{*} 00\right) \mid 0$

$(0 \mid 1)^{*} 00$
$((0 \mid 1) * 00) \mid 0$

Thompson's construction

## Post-order traversal of the regexp tree

$$
\begin{aligned}
